

Section 5 topics 1-6 review

Here is the graph of the function f_x .

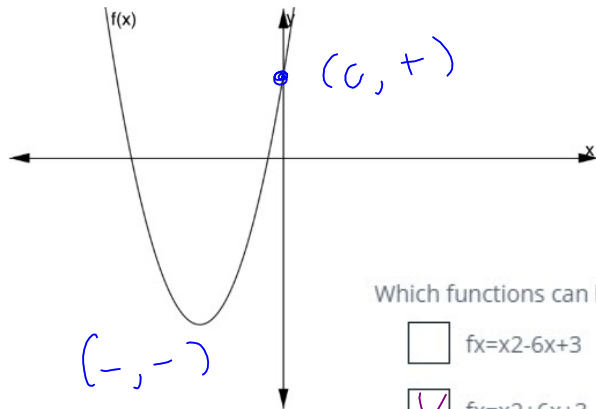

A.O.S $\frac{-b}{2a}$

Which functions have a larger maximum than f_x ? Select all that apply.

- $u_x = -x^2 + 2x + 2$ $-2/-2 = 1$ $-(1)^2 + 2(1) + 2 = -1 + 2 + 2 = 3$ (1, 3)
- $g_x = -x^2 + 4x + 6$ $-4/-2 = 2$ $-(2)^2 + 4(2) + 6 = -4 + 8 + 6 = 10$ (2, 10)
- $h_x = -x^2 + 8x + 3$ $-8/-2 = 4$ $-(4)^2 + 8(4) + 3 = -16 + 32 + 3 = 19$
- $t_x = -2x^2 + 3x + 10$ $-3/-4 = 0.75$ $-2(0.75)^2 + 3(0.75) + 10 = -1.125 + 2.25 + 10 = 11.125$
- $k_x = -2x^2 + 7x + 14$ $-7/-4 = 1.75$

Here is the graph of $f(x)$.

Which functions can be representations of the graph of $f(x)$? Select all that apply.

- $f(x) = x^2 - 6x + 3$
- $f(x) = x^2 + 6x + 3$
- ~~$f(x) = x^2 + 6x - 3$~~
- $f(x) = x^2 + 18x + 5$
- $f(x) = x^2 - 18x + 5$
- ~~$f(x) = x^2 + 18x - 5$~~

The graph of the function $P(x)$ models the amount of money a business will make for producing and selling x packs of dehydrated mangoes.

$$x = \frac{-b}{2a}$$

The function,

- (A) $P(x) = -0.050x^2 + 6x - 55$
- (B) $P(x) = -0.050x^2 - 6x - 55$
- (C) $P(x) = -0.050x^2 - 6x + 55$
- (D) $P(x) = -0.050x^2 + 6x + 55$

$$\frac{-6}{2(-0.05)}$$

can be used to find the number of packs,

- (A) 10
- (B) 60
- (C) 110

they will have to sell for maximum profit.

Isla wrote a quadratic function in vertex form. She challenged her friend, Milo, to guess the function based on clues that she provides. The clues are as follows:

- My function has a maximum point at (2, 8).
- My function passes through the origin.
- My function has an additional x-intercept at (4, 0).

Which function should be Milo's guess?

- A ~~$f(x) = x^2 + 22 + 8$~~
- B ~~$f(x) = 2x^2 + 22 + 8$~~
- C $f(x) = -x^2 + 22 + 8$
- D $f(x) = -2x^2 + 22 + 8$

$$y = a(x-h)^2 + k$$

$$0 = a(0-2)^2 + 8$$

$$0 = 4a + 8$$

$$-8 = 4a$$

$$a = -2$$

The graph shows the height of a pebble above a lake, $h(t)$, as a function of time measured in seconds.

The function modeled in the graph is

- A $h(t) = -16t^2 - 64t + 12$
- B $h(t) = -16t^2 - 32t + 10$
- C $h(t) = -16t^2 + 64t + 26$

Factoring the function gives the zeros of the function, where

- A $x=0$
- B $x=1$
- C $x \approx 2.3$

is equivalent to the time when the pebble hits the surface of the water.

The movement of a bird is shown in the graph, where h is the bird's height in meters after t seconds.

Which of the following are possible functions of the bird's flight? Select all that apply.

- $h = -t - 32 + 11$
- $h = -t - 52 + 16$
- $h = -t - 3 + 11$
- $h = -t - 5 + 10$
- $h = -t - 32 + 11$
- $h = -t - 52 + 10$

The movement of fireworks launched from a ship at sea is shown on the graph, where h is height in feet after t seconds.

$$y = a(x-h)^2 + k$$

$$0 = a(0-2)^2 + 1000$$

$$0 = 4a + 1000$$

$$\sim 1000 = 4a$$

$$a = -250$$

$$y = -250(x-2)^2 + 1000$$

$$y = -250(x^2 - 4x + 4) + 1000$$

$$y = -250x^2 + 1000x - 1000 + 1000$$

$$y = -250x^2 + 1000x$$

The graph represents the projected profit function of Green & Clean Car Manufacturer, where x represents quantity sold and $f(x)$ represents the profit in millions of dollars.

The vertex form of the graph is

A $f(x) = -100x - 1002 + 104$

B $f(x) = -0.01x - 1002 + 104$

C $f(x) = -0.01x + 1002 + 104$

and the company attains a maximum profit of

A \$4,000,000

B \$100,000,000

C \$104,000,000
